ABSTRACT OF THE DISCLOSURE

A telephone set and information terminal are connected by a packet switched network. The information terminal has a control target list in which a predetermined telephone set is stored, and a first control means. The first control means generates, based on an instruction from the user (#201), a control command wherein an instruction related to voice communication is recorded, and sends that command to the predetermined telephone set (#202). telephone set has a terminal list wherein is stored a predetermined information terminal, and a second control The second control means generates (#204, 205), based on a control command received from the predetermined information terminal (#203), a call control command for performing voice communication with another telephone set on the packet switched network, and sends that command to the other telephone set (#206).
